

Slides 1.12: Is This Food Video True?

Lesson 1.12, one day. Twelve slides. Build the deck from this outline. Student-facing text reads at grade 6 to 7. Do not put the video creator's name or face on any slide.

Slide 1: Do now

- A food video has ten million views. Does that make it more likely to be true?
- Yes or no, and one reason.
- Then: write one food “fact” you learned from a video or a post this year.
- Two minutes. Notes: Hands up for yes, for no. Write four of the “facts” on the board without judging them.

Slide 2: Watch

- [The video plays here. 60 to 90 seconds. Captions on.] Notes: Say nothing when it ends. Wait five seconds. “Is it true? You have no idea. Neither do I, yet. Let’s find out how you would know.” *[Sal: pick a claim about food, not bodies or weight. Download it so it plays without ads.]*

Slide 3: Question 1, who wrote it?

- A real name and a job you can check?
- Or a handle and a nice smile?
- A registered dietitian (RD or RDN) has a license. They can lose it for bad advice.
- A doctor, a nurse, a food scientist: also checkable. “Wellness coach” is not a license. Image: a person icon with a question mark.

Slide 4: Question 2, what do they sell?

- A supplement? A program? A book? A discount code?
- If nothing, what do they get? Views. Followers. Attention. That is worth money too.
- Sponsored content is supposed to say “ad” or “paid partnership.” It does not always.
- A .gov or .edu page is usually not selling anything. Image: a price tag icon.

Slide 5: Question 3, what is the evidence?

- A study you could find, with a name?
- A label? A number? A source you could click?
- Or “studies show,” “doctors hate this,” “trust me”?
- “Everyone knows” is not evidence. Neither is a before and after photo. Image: a magnifying glass icon.

Slide 6: Question 4, when was it posted?

- Food advice changes. Eggs were “bad” for years. Then they were not.
- An old post can be wrong now.
- A page with no date is a warning sign. Image: a calendar icon.

Slide 7: Watch again, and answer

- Same video, second time.
- With your partner, answer the four questions on the handout.
- Write what you can see, not what you guess. Notes: Play it again. Then take answers as a class, one question at a time. Question 2 usually cracks it open.

Slide 8: The three-source check

- Three printed sources on the same claim.
- Source A: the person making the claim. Source B: a page from someone with a license and no product. Source C: a company that sells something related.
- Fill the table. Mark each one credible or not, and name the question it passed or failed.
- Then your verdict: true, false, partly true, or cannot tell. And the source that decided it.
- Thirteen minutes. Notes: Push: “You marked it credible. Which of the four questions did it pass?” A pair that marks all three credible has not used the questions.

Slide 9: Build the class checklist

- What did you look for that worked? Give me a question.
- At least six. I will write them up. We sharpen each one until a sixth grader could use it.
- “Is there a study?” becomes “Does it name a study I could find?” Notes: Chart paper. This checklist stays on the wall through the \$40 project.

Slide 10: Test it

- Run the do now video against our checklist. One question at a time.
- Class vote on each: pass or fail.
- Count the passes.
- Ten million views. How many passes? Notes: Write the score on the board next to the view count.

Slide 11: The do now “facts”

- Pick one of the four “facts” on the board.
- Which checklist question would it fail first?
- Essential question: if a video has ten million views, is it more likely to be true? Notes: Two minutes. Pairs answer; then the class answers the essential question with the count as evidence.

Slide 12: Exit card

- 3 of the four source questions.
- 2 signs a food source is credible.
- 1 food “fact” you will check before you repeat it.
- Three volunteers read one line. Notes: The Label Reading Quiz comes after Lab 2. The checklist goes back on the screen for two minutes before it.
